

Usability Lab 5 – Using ARIA Attributes (4% of final grade)

Using the *Lab_ARIA.html* file, add screen reader support by including appropriate ARIA attributes to satisfy the requirements listed below.

REQUIREMENTS:

Create code to support the following ARIA opportunities:

1. We should let the screen reader know that the “hamburger” icon controls the hidden menu and that the item it controls is not currently expanded. We should also add a label to override the HTML entity description. **(1%)**
2. We should let the screen reader know that the hidden unordered list is for navigation and that it is hidden. **(1%)**
3. We should let the screen reader know that the `<h3>` we are using for messaging serves an alert function, and that it is hidden **(0.5%)**
4. The text on our submit button is a little vague. We should add an ARIA label to let the screen reader know what clicking that button means. **(0.5%)**
5. When our nav menu is open, we should change the `aria-hidden="true"` attribute of the unordered list in our JavaScript function, and update the expanded attribute of the “hamburger” icon. **(1%)**
